

PLS Group pitch night pack

College Investors · FMAA x Shared Value Project, Campus Heats · Tuesday 15 September, 6:30pm, Zoom · ten minutes presenting, five minutes Q&A. **Second edition, rebuilt after the council review.**

1. Tonight

CALL	TARGET	LAST CLOSE	UPSIDE	TOTAL RETURN	REWARD / RISK
BUY	A\$6.14	A\$4.52 (Fri 11 Sep)	+35.8%	37.7% vs 5.90%	2.00x

Speakers in order. Declan 0:00–1:10, Jacqui 1:16–3:01, Nicholas 3:07–5:37, William 5:43–8:18. The script measures 8:03 of speech. With four handovers at six seconds you land at **8:18**, which leaves a minute and three quarters of real buffer inside the ten.

Numbers to have in front of you. Base-case DCF A\$6.53, probability-weighted A\$6.08, bear A\$2.30, bull A\$8.96, SOTP equity NAV A\$4.47, net cash A\$1,437m, WACC 8.88%, shares 3,220m, market cap A\$14.55bn.

Check Tuesday's close before you join

One line ready: *“Priced at the eleventh of September close of four fifty-two. It last traded at X, which moves the implied upside to Y and changes nothing in the thesis.”* The threshold that matters is A\$5.18. Below it your Monte Carlo median sits above the price.

2. What changed, and why

You have rehearsed the first edition. Six things moved. Nothing was added.

- Declan's opening is rebuilt.** The drawdown reframe and the position size now land inside the first sixty seconds. They used to arrive at 7:10 and 8:45, as housekeeping. The stock fell 17.5% and your valuation did not move: that gap is the argument for why a shared-value lens finds mispricing, so it opens the pitch rather than closing it.
- The thesis contradiction is resolved out loud.** The old script claimed an advantage, then admitted nobody can verify it, then carried it at zero. A judge who joins those three up asks what they are buying. Nicholas now says declarability is not a premium, it is the condition for the base case existing at all. Same facts, and it survives questioning.
- p6 is cut entirely, and p4 is halved.** Together with smaller trims that is 84 seconds of speech, against the 60 to 90 the review asked for. The storage pillar moves to the Q&A bank, where it answers a question rather than filling a slot.
- The reward-to-risk arithmetic is conceded before it is challenged.** Two to one is an unweighted scenario spread. William now says so and gives the weighted number instead.
- The self-corrections are gone from the script.** “The figure printed on this slide is struck against the five forty-eight close” volunteered a reason to distrust the deck. The Monte Carlo basis is a Q&A answer now, not a spoken aside. The one correction that must be spoken is in Declan's opening, once, as a strength.
- “Better than a coin flip” is deleted.** It was the most quotable line in the script and it was a confession. Say the number, say the sizing, move on.

3. Script

1,142 spoken words. 8:03 at 142 words a minute, 8:18 with handovers. Read it twice out loud tonight. By the third run you will be paraphrasing, which is the point: the script fixes the order and the numbers, not the delivery. Grey italic lines are stage directions.

Declan

0:00 → 1:10

p1 Title

5s

“Good evening. We're the College Investors, and our recommendation is PLS Group.”

Advance immediately. Do not read the tagline.

p2 Executive summary

65s

“Buy PLS Group. Twelve-month target six dollars fourteen.

When we submitted this deck the upside was twelve per cent. Nine days later the stock is down seventeen and a half, it closed Friday at four fifty-two, and the upside is thirty-six. Not one number in our model changed. The market repriced the commodity and sold the franchise along with it. That gap is the trade.

Here's the thesis in a sentence. PLS is the lowest-cost producer of a commodity whose buyers are about to be required by law to declare its carbon footprint. Of the six companies we screened, it's the only one that can sell a tonne the others won't be allowed to sell.

We'd take three per cent of the fund, built over three entries rather than one, and we're out if spodumene averages twenty per cent below our base case. Jacqui, Nick and Will will take you through it.”

This is the most important minute of the night. Rehearse it more than anything else. It reframes the drawdown as evidence, puts the size in front of allocators immediately, and removes the apologetic register from everything that follows.

Jacqui

1:16 → 3:01

p4 Out of the downturn stronger

30s

“FY26 was a record year, and two numbers from it matter tonight.

First, unit costs fell nine per cent while volumes rose seventeen. Costs down, volumes up, through the worst lithium downturn in a decade.

Second, the exit rate. The June quarter realised two thousand one hundred US dollars a tonne, against a full-year average of fourteen eighty-eight. PLS finished the year earning forty per cent more per tonne than it averaged across it, and FY27 annualises that.”

The old version read six statistics off the slide. These two are the only ones that do work. Let them read the rest.

"Now the part that works against us. Prices tripled off the 2025 trough, then fell two hundred and seventy US dollars a tonne in a single week in August, as Bald Hill, Finniss and Jianxiawo all moved to restart. That happened, and it sits in our bear case.

On what comes next the forecasters disagree. Fastmarkets, Morgan Stanley and UBS all call a deficit in 2026. Macquarie calls it roughly balanced. We took the cautious side. Our FY27 assumption is seventeen hundred a tonne, eleven per cent below spot, so the recommendation doesn't need the spike to hold."

p7 The cost curve

35s

"Here's why the bear case is survivable. It assumes a realised price of about eleven hundred and forty-five US dollars a tonne. At that price the top decile of world supply is under water, and PLS is still earning around seven hundred and twenty US dollars a tonne of cash margin.

That's what swing supply means in practice. The marginal tonne leaves the market before the low-cost tonne does. Nick."

US\$720, not A\$720. The footnote on this slide is about exactly that conversion.

p6 is cut

Supply shocks and the storage pillar are gone from the script. They are strong material and they now sit in Jacqui's Q&A bank under "What if EV demand disappoints?", where they answer something rather than fill a slot. If you have visible time in hand at 3:01, you may still take it. Assume you do not.

p8 Three levels of shared value

35s

“Porter and Kramer give three levels, and we've put a number on each.

Level two solves an environmental problem in a way that lowers cost. Ore sorting, diesel to gas. Thirty cents a share, and every competent operator gets there, so it buys no advantage.

Level three builds what the growth depends on. Thirteen cents, and it keeps P2000 on schedule.

Level one opens a market that didn't exist. Thirty-two cents, and we've priced it at zero. Of the six, PLS is the only one there.”

Walk the three rows in the order they appear on screen and attach the number to each. A judge reading the money bar while you talk about something else is a judge you have lost.

p9 Carbon intensity as a condition of sale

70s

“Four gates. Calcine, declare, qualify, sell.

Gate one. The Calix plant is fully owned by PLS and opened in June. It cuts calcination emissions by more than eighty per cent, and calcination is the most energy-intensive step in the whole chain.

Gate two is what that buys. Removing those emissions makes a low carbon footprint declarable rather than merely claimed, so nobody has to take PLS's word for it.

Gate three is set by regulators, not by PLS. From 2027 the EU Battery Regulation requires a carbon footprint declaration and a battery passport. US rules restrict China-linked chains.

Gate four is the route. PLS supplies an eighteen per cent owned hydroxide joint venture in Korea, with an option to take that stake to thirty.

Now the part that matters. We do not value declarability as a premium, because nobody has paid one yet. We value it as the reason the revenue line still exists in 2030. If PLS cannot declare, the base case isn't six fifty-three with less upside. There is no base case.”

This closing sentence is the fix for the hole in the old script. The first edition claimed an advantage, admitted nobody could verify it, then carried it at zero, which invites “so what am I buying?” This says the same facts as a discipline rather than a hedge, and it holds up under questioning.

Slowest slide in the deck. Walk the four boxes left to right with the cursor.

"The case asked for a critical eye, so we went looking for holes in PLS's own story. We found six. Three of them matter.

The net-zero commitment is the decade commencing 2040. A decade, not a year, and no SBTi validation.

There's no Scope 3 disclosure, for a company whose product is consumed downstream.

And there's no emissions intensity per tonne, which means nobody can independently verify the carbon advantage I've just spent a minute underwriting. We put that on the slide rather than in an appendix.

Every gap we found sits in the first two columns. Our verified column is empty, and we printed it that way. Will."

Six gaps became three. The offsets fund and the tailings method stay in your Q&A bank. Do not apologise while saying these: conceding a weak point before it is raised is what buys the credibility.

William

5:43 → 8:18

p12 The bridge is an attribution

40s

"One thing before anyone asks about double counting. Nothing on this page is added to the DCF. Ore sorting and the power strategy already sit inside the five hundred and sixty-nine dollar cost base the model discounts, and adding them again would count the same cash flow twice.

So this is an attribution, not an addition. We're asking where the value comes from, not adding it up twice. Forty-three cents of the target comes from those ESG-linked operating decisions, and that figure hasn't moved since we submitted."

You no longer explain the 27%. Declan handled the denominator in the first minute. If a judge raises it anyway, landmine 2 has the answer.

p13 An annuity, not a perpetuity

40s

"Most DCFs end with a perpetuity growing at two and a half per cent forever. A mine runs out.

Pilgangoora consumes a hundred and four of its three hundred and thirty-four million mineable tonnes by FY36, and exits at fourteen point three million tonnes a year. That leaves about sixteen years, so we value the terminal period as a sixteen-year annuity over the ore that's actually left.

That one choice is worth nine billion dollars. A perpetuity would have handed us nineteen billion of terminal value on an asset that runs out."

If asked whether the mine life is before or after the expansion: after. Remaining ore over the FY36 rate, which already includes P2000.

“Base case six fifty-three, bear two thirty, bull eight ninety-six. The six fourteen target is sixty per cent base-case DCF and forty per cent trading comparables.

Against Friday's close that's forty-nine per cent of downside to the bear and ninety-eight to the bull. Two to one, and that's unweighted. Weight it with our own probabilities and the expected value is six dollars eight, which is thirty-five per cent above the close.

At four fifty-two, about fifty-eight per cent of our twenty thousand simulated outcomes land above the price.

Which is why the position is sized the way Declan described. Three per cent of the fund, three entries, out on a twenty per cent relapse.”

Two changes here. The unweighted ratio is conceded before a quant judge does it in their head. And there is no “better than a coin flip” and no explanation of which close the simulation was struck against. If they ask, landmine 3 has it.

p16 Recommendation

30s

“Buy PLS Group. Six dollars fourteen. Thirty-six per cent above Friday's close, thirty-eight per cent total return against a benchmark that made five point nine. The mandate needs two points of outperformance, and this gives thirty-two.

Two catalysts sit inside the quarter. First lithium phosphate from the mid-stream plant is guided for this one, and the P2000 study lands in the December quarter.

Thank you. We're happy to take questions.”

Then stop. Do not fill the silence. The silence is the judges' turn.

4. Run sheet

CLOCK	WHO	PAGE	SLIDE	SEC
0:00	Declan	p1	Title	5
0:05	Declan	p2	Executive summary, drawdown reframe, sizing	65
handover · say Jacqui's name · running 1:16				
1:16	Jacqui	p4	Out of the downturn stronger	30
1:46	Jacqui	p5	A saw-tooth, not a straight line	40
2:26	Jacqui	p7	The cost curve	35
handover · say Nicholas's name · running 3:07				
3:07	Nicholas	p8	Three levels of shared value	35
3:42	Nicholas	p9	Carbon intensity as a condition of sale	70
4:52	Nicholas	p11	The gaps we found	45
handover · say William's name · running 5:43				
5:43	William	p12	The bridge is an attribution	40
6:23	William	p13	An annuity, not a perpetuity	40
7:03	William	p14	The range, and what has to be true	45
7:48	William	p16	Recommendation	30
finish 8:18 · 1:42 of buffer before the ten-minute mark				

Checkpoints. Jacqui starts at 1:16, Nicholas at 3:07, William at 5:43. If the person before you ran long, *you* cut, not them. Every slot below 45 seconds has no fat left in it, so the cut comes from p5's forecaster list or p9's gate four.

Left out of the running order, kept as Q&A jumps. p3 answers why PLS and not IGO or Mineral Resources. p6 is supply shocks and storage demand. p10 answers whether ore sorting is just cost cutting with a green label. p15 is the twelve-risk register.

Read the numbers as words, not digits. “Two thousand one hundred US dollars a tonne” survives Zoom audio. “Twenty-one hundred” does not, and it invites you to swallow the currency.

Three numbers per speaker, said twice

This is the discipline that replaced the old stat dump. Declan: 6.14, 4.52, 3% of the fund. Jacqui: costs down 9 / volumes up 17, US\$1,145, US\$720. Nicholas: 30 cents, 13 cents, 32 cents. William: 16 years, A\$9bn against A\$19bn, 58%. Anything else on the slide is theirs to read.

5. The five minutes of Q&A

A third of the scored time, and the first edition allocated nothing to it. This is where your three known weak points get tested.

How to operate it

- **One question, one answer, from the named person.** Nobody adds a coda. Four people half-answering one question is the most common way a good team loses a Q&A.
- **Answer in three sentences, then stop.** Claim, evidence, consequence. If they want more they will ask.
- **“I don't know” plus the appendix page beats a guess.** Every time. The appendix map in section 8 is what makes that credible rather than evasive.
- **Concede the weak point before it is raised.** You have already done this twice in the script, on p11 and p14. Keep doing it.

Who owns what

Declan	The call, the drawdown, position size, exits, anything that starts “were you wrong”.
Jacqui	Spodumene price, supply and restarts, demand, costs, currency.
Nicholas	Shared value, carbon, the EU regulation, the gaps, engagement asks.
William	DCF, WACC, terminal value, comparables, NAV, Monte Carlo, short interest.

The three you will get

1. “Your deck said A\$5.48 and it's A\$4.52. Were you wrong?”

Declan, twenty seconds. “Our estimate of what the business is worth hasn't changed. The price we'd pay for it has. At five forty-eight the upside was twelve per cent and we were buyers. At four fifty-two it's thirty-six. If we were willing to buy it then, we have to be more willing now, or we never believed our own number.”

The caveat that proves you are not spinning: “That holds as long as the fall is the market repricing the same cash flows. If it's a cut to the forward price curve our value comes down too. A ten per cent downgrade to realised price takes the base case from six fifty-three to about five thirteen.”

2. “Your own Monte Carlo says 46.6%. That's a coin flip.”

William, twenty seconds. “That figure is struck against the five forty-eight close of the six September run, and the slide says so. Read the same distribution at four fifty-two and it's about fifty-eight per cent, and the median moves from five per cent below the price to about fifteen above. We flagged the basis rather than restate a simulation we couldn't re-run before the deadline.”

Do not volunteer this. It only comes out if asked.

3. “How much, and when do you sell?”

Declan, twenty seconds. “Three per cent of the fund, in three tranches of one. Out if spodumene averages more than twenty per cent below our base case across two consecutive quarters. Halve it if P2000 slips past December. Trim to index weight at six fourteen and re-underwrite rather than run it.”

If they ask why it isn't in the deck: “It should have been. We wrote a valuation when the case asked for an investment decision.” Owning it is worth more than defending it.

6. Landmines

Four things an attentive judge can find in your own files. The judges are holding the submitted deck, so these cannot be tidied away. Saying each one first converts a weakness into evidence that you audit your own work.

1. Sixty-six per cent of the upside became twenty-seven

Your original spine was “two thirds of the upside is shared value”. At A\$4.52 the upside is A\$1.62 rather than A\$0.66, so the same A\$0.43 is now 27%. The deck says so honestly, but a judge who read the original framing will press it.

“The numerator didn't move. The denominator did. Forty-three cents of value from ESG-linked operating decisions is there at five forty-eight and at four fifty-two. It's the only part of this thesis that didn't change in a week when everything else fell seventeen per cent.”

If pushed further, give the stable measures: A\$0.43 is 6.6% of the A\$6.53 base-case DCF and 7.0% of the A\$6.14 target. Neither denominator moves with the tape.

2. Two Monte Carlo probabilities are still on the old basis

You relabelled the headline figure and the percentile column. Two rows were not relabelled.

REPORTED	AS SHOWN	CORRECT AT A\$4.52
Intrinsic value above last close	46.6%	~57.7%
More than 20% below last close	40.9%	~31.4%
More than doubles	6.8%	~15.6%
Median vs price	-5.3%	+14.8%

These are read off your own published histogram, so they are close but not re-run. Say exactly that if asked.

3. The thesis carries no money and the money carries no thesis

The sharpest thing the review found, and the reason Nicholas's p9 ending changed. The old script claimed PLS can sell a tonne others cannot, then admitted the advantage is unverifiable, then carried it at zero. Meanwhile the A\$0.43 that does carry dollars comes from ore sorting and power, which Nicholas himself had dismissed forty seconds earlier as buying nobody an advantage.

“Two different things. The forty-three cents is what the operating decisions are worth today, and we can show you the cost line it comes out of. Declarability isn't worth a premium today because nobody has paid one. It's worth the revenue line in 2030. One is a number in the model. The other is the condition for the model having a revenue line at all.”

4. Nowhere in 81 slides do you say how much, or when you sell

A valuation is not an investment decision. Declan now lands the 3% inside the first minute, so this only comes up as “why wasn't it in the deck?”. Answer it plainly and move on.

7. Position sizing

Nothing here is invented. It comes out of the Returns sheet, so “why three per cent and not ten?” has an arithmetic answer rather than an opinion.

The rule

The mandate is to beat the ASX 200 by two percentage points. A single idea that can cost more than 1.5% of fund NAV puts that at risk on its own. So the maximum weight is the loss tolerance divided by the downside to the bear case.

1.5% of NAV at risk ÷ 49.1% downside to bear (A\$2.30) = a 3.0% position.

Run it the other way and it reads as a mandate answer. A 98.2% move to the bull case on a 3% weight contributes +2.9% to fund return. The base case at 37.7% contributes +1.13%, which is over half the two points of outperformance required, from one position.

How it gets built

- **Tranche 1:** on approval, at market.
- **Tranche 2:** after the September-quarter activities report in October, the first full quarter at the post-restart run rate.
- **Tranche 3:** on the P2000 definitive feasibility study in the December quarter, or earlier if the stock trades below A\$4.00 with the thesis intact.

Exit triggers

- **Exit:** spodumene averages more than 20% below our base case across two consecutive quarters.
- **Halve:** P2000 deferred beyond the December 2026 quarter, or an FID that does not follow the study.
- **Reduce to 1%:** an Ore Reserve statement implying conversion below 60%, which costs about A\$0.40 a share.
- **Trim to index weight:** the A\$6.14 target is reached, then re-underwrite rather than run it.
- **Review:** an 18-month time stop with no P2000 FID.

What the market is pricing

Your sensitivity grid gives A\$5.09 at –10% on realised price and A\$3.65 at –20%. A\$4.52 interpolates to about –14%, and the base case already sits 11% below spot-implied realisation. So the market is pricing spodumene roughly 24% below where it has been realising.

The second line of defence sits next to it. Your SOTP puts risk-weighted equity NAV at A\$4.47 and the stock closed at A\$4.52. The market is paying your most conservative measure and nothing at all for the business that keeps converting resource into reserve.

8. Q&A bank

Whoever is named takes the question. Everyone else stays quiet.

Declan

Why did it fall 7.4% on Friday?	No company-specific announcement we've found; it moved with the lithium complex. Say you don't know rather than invent a reason, then say what would change your mind: the next SpodIX prints and the October quarterly.
Why buy now rather than wait for a lower price?	We are partly waiting, which is what three tranches means. But two catalysts sit inside the quarter. Waiting for a better price is a bet on timing we don't claim an edge in.
Is this a lithium price bet with an ESG slide attached?	Partly, and we say so. The carbon position decides who gets to sell when the cycle turns. We value the premium at zero inside the target, so the recommendation doesn't need it.
What's the weakest part of your own work?	Reserve conversion at 75%, the FY26 opening PP&E estimate we couldn't retrieve, and sizing the position after the deck rather than inside it. Appendix F4 is the register of every gap.

Jacqui

Spodumene is around US\$2,100. Your FY27 is US\$1,700. Why so conservative?	Deliberate. 11% below spot-implied realisation and below the Australian Government's own forecast. We don't want to win this on out-forecasting the commodity.
Restart supply is coming back. Doesn't that cap the price?	It's exactly our bear case: Bald Hill, Finniss and Jianxiawo all returning, Wood Mackenzie's surplus into the early 2030s. PLS still values at A\$2.30 in it.
What if EV demand disappoints?	That's why the second pillar is storage. Grid storage grew about 51% in 2025 and went from 23% to 31% of lithium demand in a single year, pulled by datacentre power. It doesn't depend on any government's vehicle policy.
Is A\$569 a tonne sustainable, or is it a volume effect?	Partly volume, and we say so. FY26 costs fell A\$58/t while volumes rose 17%, so roughly half is fixed-cost dilution and we attribute the other half to ore sorting. That split is our estimate, not a disclosure.
China suspended Jianxiawo twice in thirteen months. How do you underwrite that?	We don't forecast it. We treat it as evidence the supply side is politically fragile in both directions. With Zimbabwe's export ban that's a pattern, not a coincidence.
What about sodium-ion in stationary storage?	Real, late-decade at the earliest, and on our risk register. It's also a reason our terminal value is a sixteen-year annuity rather than a perpetuity.
Currency: you sell in US dollars and pay costs in Australian.	A natural hedge in a downturn: a weaker AUD lifts margins exactly when the price falls. We forecast a 0.66 to 0.70 path and watch it as a named indicator.

Nicholas

Isn't ore sorting just cost cutting with a green label?	Yes, and slide p10 says so. Worth about A\$48/t and it is level two, something any good operator does. We don't claim it as the differentiator. Level one is electric calcination and declarability.
--	--

Where is the evidence that anyone actually pays a carbon premium?	There isn't any in PLS's disclosed contracts, which is why we value it at zero in the target and risk it at 25% outside. The first contract with a disclosed carbon-linked term is the indicator we watch.
The EU Battery Regulation: is 2027 real, or aspirational?	The carbon footprint declaration and battery passport requirements are the gate. The gate is the point, not the premium: a tonne without a declaration is excluded regardless of price.
No Scope 3 and no emissions intensity per tonne. Doesn't that kill the carbon thesis?	It's the weak point and our first engagement ask. We're underwriting an advantage nobody can currently verify from the disclosure, and we put that on slide p11 rather than hiding it in an appendix.
What's the Pilbara offsets finding, and why does it matter?	The regional offsets scheme miners point to was independently found underfunded at A\$893 to A\$3,781 a hectare. No Pilbara miner, PLS included, can claim biodiversity risk is mitigated by pointing at it. Appendix D6.
You're a long-only holder. What would you actually do as a shareholder?	Three asks: publish emissions intensity per tonne of concentrate, set a Scope 3 boundary, and put an ESG measure into executive incentive pay. Appendix D11.
Why PLS rather than IGO, Mineral Resources or Liontown?	For four of the six, ESG spend defends a cash flow that already exists. Only PLS operates where the environmental outcome is the demand. Appendix C6. Concede first that PLS is also the riskiest of the six.
Is ESG in management's pay?	Not visibly, and we call it a gap. What's there is structural: a standing board Sustainability Committee. The absence of ESG-linked pay is one of our three engagement asks.

William

Beta of 0.73 for a single-asset lithium miner? That WACC looks low.	Risk-free rate, market risk premium and equity beta are prescribed by the case document. Gearing and debt cost are ours. We sensitise WACC by 60bp inside the Monte Carlo.
Defend the annuity terminal value.	An orebody is finite. 334.5Mt mineable, 104Mt mined by FY36, exiting at 14.3Mt a year, so 16.1 years left. A perpetuity gives A\$19.0bn of terminal value instead of A\$9.9bn on an asset that runs out. If challenged on pre- or post-expansion: post.
75% resource-to-reserve conversion is aggressive.	Our biggest judgement and flagged as one. The 214Mt Ore Reserve alone, last stated August 2023, would not support the expansion we model. Below 60% costs about A\$0.40 a share.
Why 60% DCF and 40% comparables?	The DCF is the only method that prices the volume growth from P2000 and Colina. Comparables carry 40% as the discipline of what the market pays for a producing miner today.
Your NAV is A\$4.47 and the stock is A\$4.52. Doesn't that say fairly valued?	Strongest answer you own. The NAV is the conservative frame: every asset separately, risk-weighted, nothing for continuity. The market is paying exactly that and nothing for a business that keeps converting resource into reserve into cash flow.
Terminal value is 50.7% of enterprise value. Isn't that too much of the answer?	It's low for a miner, and that's the point of the annuity. On a growing perpetuity it would have been about 68%, with most of the valuation resting on an assumption no orebody can honour.
Reconcile A\$1,437m of net cash with A\$2,290m of cash on hand.	A\$853m of borrowings and the timing of the reported balance. Net cash is the figure in the bridge from enterprise to equity value. Appendix E12 has the

walk.

Why exclude the downstream option rather than include it at 45%?

None of it is earning yet. Target plus the risked option would be A\$6.46. We don't publish that number. A\$2,396m unrisks, A\$1,023m risks, A\$0.32 a share, appendix E15.

Short interest has rebuilt through your own 10% warning level.

10.09% at 4 August, up 0.75pp in a week, and we report it rather than dropping the indicator. It doesn't move the target, which never rested on a squeeze. Appendix F2.

9. Appendix map

The fastest way to lose a Q&A is to scroll. Find the topic, call the page, jump straight there.

PAGE	REF	WHAT'S ON IT
18	A1	One orebody carries 95% of risked NAV; the route out does not run through China
20	A3	Reserve does not support the modelled expansion; conversion assumption and sensitivity
21	A4	Ore sorting: environmental improvement and cost improvement as the same decision
23	A6	P2000: A\$2.6bn incremental NPV, study due December quarter, A\$175m committed
24	A7	Ngungaju idled Dec-24, restarted Jul-26: capacity managed to price
25	A8	Mid-stream plant, opened June 2026, first production September quarter
26	A9	POSCO JV: 18% of a 43ktpa hydroxide plant, option to 30%
28	A11	Sells at prevailing prices, not fixed contracts, so it captures recovery and relapse in full
31	B2	Price history: US\$8,000 peak to US\$600-750 trough to US\$2,038-2,200 by Aug-26
33	B4	Jianxiawo: 150ktpa LCE suspended, restarted and re-suspended in thirteen months
35	B6	The August restart wave and the US\$270/t weekly fall
36	B7	Global cost curve: hard rock at the bottom, lepidolite at the top
38	B9	Storage demand: +51% installations, 23% to 31% of lithium demand
39	B10	Forecaster disagreement, presented as found rather than smoothed
46	C6	The six-company screen and why only PLS is a shared-value investment
48	D2	Emissions disclosure: directional, improved 7.1%, missing the two numbers that matter
50	D4	Ore sorting worked through: same mechanism, environmental and financial
52	D6	Tailings undisclosed; offsets scheme independently found underfunded
57	D11	The three engagement asks
65	E8	The DCF itself: FCFF, mid-year convention, annuity terminal value
68	E11	Sensitivity: price coefficient four times the cost coefficient
69	E12	Trading comparables, 8.0-11.0x FY27E EBITDA, and the EV-to-equity walk
71	E14	SOTP NAV: A\$4.47 risk-weighted, asset by asset
72	E15	Downstream option: A\$2,396m unrisked, A\$1,023m risked, A\$0.32/share, excluded
73	E16	Monte Carlo, 20,000 trials. See landmine 2 before quoting it
74	F1	Twelve risks with mitigants, residual ratings and named indicators
75	F2	Short interest: most shorted on the ASX to fortieth, and the rebuild to 10.09%

10. Before you join

Zoom

- Join at 6:25 and check audio and video before the slot starts.
- One person shares the screen for the whole ten minutes and drives the slides. Handovers are verbal, not a change of presenter.
- Say the next person's name at every handover. Nobody can see you glance at each other.
- Share the deck window, not the whole desktop, so notifications stay private.
- Everyone not speaking stays muted.

Have the model open

Almost nobody else will have a live model in the room. Put the workbook on a second screen with the Scenario Engine and Sensitivity sheets open, and rehearse three input flips: spodumene price, P2000 timing, WACC. If the Q&A gets technical, offer it: "We can run that now if you want to see it."

Two run-throughs tonight

Not more. Both on a timer, both standing, both with slide transitions actually performed rather than described. The first will run long, which is the point of doing it twice.

If you only have time for one thing

Make it Declan's opening minute. It is the only edit that fixes four problems at once: it reframes the drawdown as proof instead of damage, it puts the position size in front of allocators inside the first sixty seconds, it kills the apologetic register that ran through the whole script, and it buys back the time William used to spend explaining the denominator at 7:10.
